

ABSTRACT

A multi-function tool includes a head and a pair of handles. The head has a first jaw and a second jaw, each having a working portion and a tang. The handles have a folded configuration and an unfolded
5 configuration. A spring in the head biases the working portions apart from one another such that the handles are biased in an open position when the handles are in the unfolded configuration and the handles are biased in a closed position when the handles are in the folded configuration.
